ABSTRACTED-PUB-NO: RU 2026040C  
 BASIC-ABSTRACT:

The artificial lens consists of an optical element (1) with a peripheral groove in its edge and a support in the form of a ring (2) with curved radial arms (4).

The support ring has two diametrically-opposite curved projections (3) with their convex sides pointing away from the centres of the lens, while the ends of the arms (4) are located parallel to the plane of the optical element with a distance between the planes of 0.2-1.5 mm.

The forward projection of the arms prevents contact with the iris and the front surface of the lens.

ADVANTAGE - Reduced trauma and post-operative complications and improved implant quality. Bul. 1/10.1.95
